

# Low Cost Oil Water Separator

## Coalescing Plate Separator Domino CPS

**Special Offer:** - DCSP1500: **\$1000\***  
- DCPS3000: **\$1500\***  
(\* Pump & Panel not included)

### Operation of the CPS is simple

Oily water influent is introduced into the first section of the CPS via the pump. Heavy solids settle out immediately and fall into the hopper, whilst large oil slugs rise to the surface.

The remaining oily/water mixture flows through the closely spaced Polypropylene plates with the smaller oil droplets and fine suspended solids being progressively separated. An oil dam prevents the collected (floating) oil from escaping into the outlet pipe. Oil skimmers are provided for the removal of the accumulated oil.

Clean water passes underneath the base of the oil dam, over the outlet weir (funnel) and gravitates to the point of discharge.

**Flexible:** The Domino CPS housing can be easily upgraded to a higher capacity through replacement of the cone pack rather than replacing the whole unit.

**Skid Mounted:** All high capacity units are skid mounted for easy transportation and simple installation.

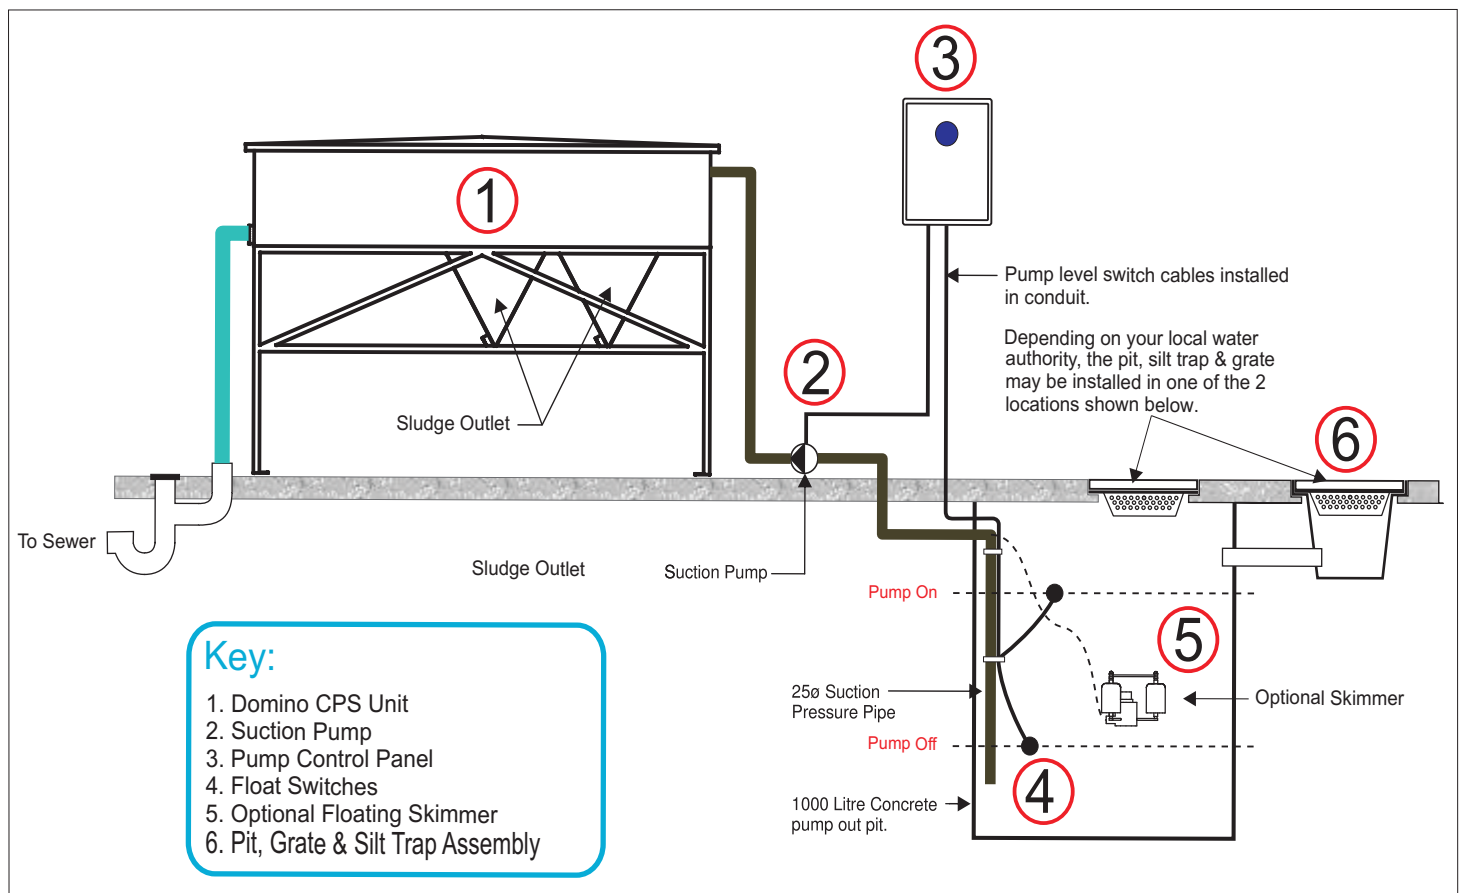

**Reliable:** Few moving parts, quality **stainless steel construction.**

**Scalable:** The base Domino CPS housing can process up to 3000/hour.

**Everything Water** offers standard upgrades to **6000,9000 or 12000 Lt/hr.**

**Safe:** All electronics to specifications as required.
